Hello,

The current folder contains the source code files corresponding to Table 1 and Table 3 in the paper. This folder includes the PGD white-box attack. There are two subfolders representing targeted and untargeted attacks, respectively.

Step 1: You need to add the corresponding parameters to the "PGD.py" and "PGD attack.py" files in both the targeted and untargeted attack subfolders. For detailed setup instructions, refer to the instructions in the source code.

Step 2: You need to run "PGD attack.py" to execute the attack and generate adversarial samples.
