

Hello,

The current folder contains the source code files. The files represent AutoAttack white-box untargeted attack under L_∞ constraint.

The execution steps are as follows:

Step 1: "[Auto_attack.py](#)" is the core attack algorithm. You need to set the corresponding hyperparameters in the remaining code files. Detailed instructions on how to set these parameters are provided within each respective code file.

Step 2: You need to run "[Auto_attack.py](#)" to execute the attack and generate adversarial samples.
