

Hello,

The current folder contains the source code files corresponding to Table 1 to Table 4 in the paper. This folder includes the MI-FGSM whitebox attack. There are two subfolders representing targeted and untargeted attacks, respectively.

Step 1: You need to add the corresponding parameters to the "[MIFGSM.py](#)" and "[MIFGSM attack.py](#)" files in both the targeted and untargeted attack subfolders. For detailed setup instructions, refer to the instructions in the source code.

Step 2: You need to run "[MIFGSM attack.py](#)" to execute the attack and generate adversarial samples.
